

Labs 01-02

Lab 01: Create a project where you have two classes: Car and Person. Car has (at least) an owner (a Person) and price. Annotate your classes and make hibernate create database tables for your project. Verify that the tables have been created.

Lab 02: Populate lab 01 tables with some entries (Java objects that can be hardcoded). Create REST services to let you a) query all cars, b) query cars a person with a given name owns, and c) query cars with a price less than given amount. Your REST services can produce responses in any format you decide.
