

Labs 01-02

1. Create Hello World -application following instructions in <http://developer.android.com/training/basics/firstapp/index.html> (up to “running your application”). Try out the application at least in emulator environment. Use “Empty Activity” template when you create the project. Add to the application also test output to console (use Log class and its method d).
2. Develop an application that has a text field (TextView class instance) and three buttons (Button instances): increment, decrement and reset which manipulate an integer value. Text field shows the current current integer value (initially 5, and at minimum 0). Buttons react to both clicks and long clicks - a click increments/decrements by 1, and a long click by 10. Use a separate class to implement the counter logic. Use RelativeLayout.
